1 Welcome to Alpi

Alpi is a small, friendly companion that floats on your Mac's screen. It looks after three jobs that usually need three separate apps:

- **Capture** – screenshots of an area, a window or the whole screen, text recognition, long scrolling captures and screen recordings with sound.
- **Edit** – a full screenshot editor with arrows, text, numbered steps, blur and redaction, highlights, a beautiful frame and image adjustments.
- **Convert** – drop files on Alpi to turn images, PDFs, documents, spreadsheets, presentations, videos and audio into other formats.

Everything runs locally on your Mac. Text recognition, face detection and conversions use Apple's built-in frameworks – nothing is uploaded.

> **Note** Alpi's interface is currently in German. Wherever it helps, this guide shows the German label in brackets, for example **Save** *(“Sichern”)*.

Requirements

- macOS 14 Sonoma or later (Apple silicon or Intel). Designed for macOS 27: Liquid Glass panels from macOS 26, Apple Intelligence features from macOS 26, image understanding from macOS 27.
- Optional for best Office conversions: Microsoft Word/PowerPoint, LibreOffice (free) or Pages/Keynote/Numbers.

Where Alpi lives

Alpi has no Dock icon. You'll find it in two places:

- **The menu bar** – a small circle with two eyes. Click it for the menu: capture, settings, the Alpi folder, About and Quit.
- **On your desktop** – Alpi himself, a turquoise orb with a face. Drag him anywhere, throw him across the screen, or let him dock at the edge.

> **Tip** Press `⌃⌥A` at any time to show or hide Alpi.

2 Getting Started

First launch

1. Open Alpi. It appears at the right edge of your screen and greets you.
2. macOS may ask for permission to access your **Documents** folder – Alpi stores its files in *Documents › Alpi*.
3. Alpi offers to **collect your macOS screenshots**. If you agree, screenshots taken with `⇧⌘3`, `⇧⌘4` or `⇧⌘5` land in Alpi's folder and appear in his Orbit instead of on your desktop. When Alpi quits, your original macOS settings are restored.
4. The first time you use Alpi's own capture (`⌃⌥S`), macOS asks for **Screen & System Audio Recording** permission. Turn Alpi on in *System Settings › Privacy & Security › Screen & System Audio Recording*, then

restart Alpi once.

Permissions at a glance

Permission	Needed for	When it's asked
Documents folder	Storing screenshots, results, videos and history	First launch
Screen & System Audio Recording	Alpi's own screenshots, scroll capture, screen recordings	First capture
Microphone	Recording your voice with a screen video	Only if you turn on “Record microphone”
Camera	The camera bubble	First time you show the camera bubble
Accessibility	Auto-scroll during a scrolling capture	Only when you press “Auto-Scroll”
Automation	Controlling Office apps for faithful conversions; reading the Finder selection for Ask Alpi	First time it's needed

> **Note** If you build Alpi yourself in Xcode without a signing team, macOS may ask for permissions again after every build. Choose your team under *Signing & Capabilities* to avoid this.

3 Meet Alpi

Alpi has moods. He floats gently, blinks, follows your mouse with his eyes, smiles when you pet him, looks surprised when you drag him, munches new screenshots and falls asleep when nothing happens for a while. He talks to you through a small speech bubble.

Moving Alpi around

Action	Result
Hover over Alpi	Alpi is happy; resting a moment opens the Orbit
Click Alpi	Keeps the Orbit open; click again to close. If Alpi shows a “?”, the click shows his suggestion
Drag Alpi	Move him anywhere – also to other displays
Throw Alpi	Drag with some speed and let go – he glides and bounces off the edges
Release near the left/right edge	Alpi docks and tucks himself away when idle
Right-click Alpi	Menu: take a screenshot, screen video, history, open Orbit, discard all, back to the edge, hide, settings

Full-screen apps

In full-screen apps (videos, presentations, Xcode in full screen) Alpi gets out of the way. Move the pointer to the very top edge of the screen for a moment – or press `⌃⌥A` – and Alpi drops down below the menu bar together with your screenshots. Move away and he disappears again. New screenshots taken in full screen are caught with

a short visit.

Two places to live

- **On the desktop** *(“Auf dem Schreibtisch”)*, the default: Alpi floats freely. To convert files, drag them straight onto him.
- **Only in the menu bar** *(“Nur in der Menüleiste”)*: Alpi stays in the menu bar icon. Click the icon to bring him down together with your screenshots. While dragging files, press `⇧`, `⌘` or `⌃` to open the conversion wheel at your pointer. Drag Alpi out of the menu bar onto the desktop to make him live there again.

Switch between the two in the menu bar menu or in *Settings › Where does Alpi live?* *(“Wo wohnt Alpi?”)*

The Orbit – your screenshot inbox

New screenshots fly into Alpi and appear as cards in a tidy column next to him – the **Orbit**. It always opens towards the middle of the screen. Up to four cards are shown; “+N more” opens the Screenshots folder.

Action on a card	Result
Hover	A small bar appears: Copy · Copy text · Smart actions · Edit · Pin
Click	Copy the image
Double-click	Open it in the Alpi Editor
Drag into an app	The app gets a copy; the card stays
Drag into a folder or onto the desktop	The file is kept there and leaves the Orbit
Drag to the Trash or click ×	Discard
Right-click	Copy, copy recognized text, edit, pin, open with Preview, show in Finder, save to desktop, discard

> **Tip** Alpi reads the text in every new screenshot in the background, but only copies it when you click **Copy text** on a card. If you prefer the old behaviour, turn on “Offer recognized text after every screenshot” in Settings.

4 Capturing the Screen

Alpi has his own capture tool. All shortcuts use Control + Option, so they never clash with the macOS shortcuts `⇧⌘3` / `⇧⌘4` / `⇧⌘5`. Every capture is also available from the menu bar menu and by right-clicking Alpi.

Shortcut	What it does
`⌃⌥S`	Capture an area or a window
`⌃⌥W`	Capture a window (picked by clicking, captured on its own without background)
`⌃⌥F`	Capture the entire screen under the pointer
`⌃⌥T`	Copy text from an area (also reads QR codes and barcodes)
`⌃⌥L`	Scrolling capture of a long page
`⌃⌥R`	Start or stop a screen recording

Shortcut	What it does
⌃⌥**P**	Pin the newest screenshot to the screen
⌃⌥**H**	Open the history
⌃⌥**V**	Clipboard history
⌃⌥**C**	Pick a colour from the screen
⌃⌥**K**	Ask Alpi
⌃⌥**D**	Draw on the screen
⌃⌥**A**	Show or hide Alpi

Selecting an area

After ⌃⌥**S** the screen freezes, so menus and tooltips stay exactly as they were. A short hint appears at the top.

- **Drag** to select an area. A magnifier next to the pointer shows the pixels, their coordinates and the colour (hex).
- **Click** a window to select it. Alpi then captures that window on its own – without the desktop behind it, even if parts were covered.
- Press **F** or ⏎ (with nothing selected) for the whole screen.
- Pick an **aspect ratio** at the top: Free, 1:1, 4:3, 3:2, 16:9 or 9:16.
- Hold ⇧ for a square, ⌥ to draw from the centre.
- Fine-tune with the handles or the arrow keys (⇧ = 10 points, ⌥ + arrows = resize).
- **Esc** cancels at any time.

After selecting – the action bar

A small bar appears below your selection:

Button	Key	Result
Edit *(“Bearbeiten”)*	**E**	Open the capture in the Alpi Editor
Copy *(“Kopieren”)*	⌘**C**	Copy to the clipboard
Save *(“Sichern”)*	⌘**S**	Save as PNG into *Alpi* › *Screenshots* (appears in the Orbit)
Text *(“Text kopieren”)*	**T**	Recognize the text and copy it
Pin *(“Anheften”)*	**P**	Float the capture above all windows
Done *(“Fertig”)*	⏎ or double-click	Quick action – by default *copy and save* (change in Settings)

> **Tip** Captures are saved with the correct Retina resolution, so they paste at the right size. Alpi himself never appears in your captures.

Self-timer

Need to open a menu first? In the menu bar menu choose **With self-timer** *(“Mit Selbstauslöser”)* and pick 3, 5 or 10 seconds – for an area or the whole screen. A large countdown appears; **Esc** cancels it.

Copy text and QR codes

Press **⌃⌥T** and drag over any text – even text in images, videos or apps that don't let you select it. Alpi copies it to the clipboard and shows a preview. If the area contains a QR code with a link, Alpi offers to open it.

Scrolling capture

1. Press **⌃⌥L** and select the part of the window that scrolls (or click the window).
2. A dashed frame marks the area and a small panel appears next to it.
3. Scroll down slowly. Alpi stitches the pieces together and shows a live preview and the current height.
4. Click **Done** *(“Fertig”)*. The long image is saved and opens in the editor.

Sticky headers and footers (toolbars, cookie banners) are detected and appear only once. If you scroll too fast, Alpi asks you to scroll back a little.

> **Tip** Click **Auto-Scroll** to let Alpi scroll for you. It stops by itself at the bottom. This needs the Accessibility permission; keep the pointer over the area.

5 The Editor

Open the editor with **Edit** in the action bar, by double-clicking an Orbit card, from the history or by double-clicking a pinned image. The window has a toolbar at the top, the canvas in the middle, an inspector on the right and actions at the bottom. The inspector has three panels: **Annotate** *(“Markieren”)*, **Frame** *(“Rahmen”)* and **Image** *(“Bild”)*.

Tools

Key	Tool	How it works
V	Select	Click to select, drag to move, drag the round handles to reshape. Double-click text to edit it
A	Arrow	Five styles: arrow, double arrow, wedge, curved (drag the middle handle to bend), open
L	Line	Straight line; ⇧ snaps to 45°
R	Rectangle	Outline, half-transparent or solid fill; square, round or very round corners
O	Ellipse	Same fills as the rectangle; ⇧ draws a circle
T	Text	Click and type. Optional coloured background. **Esc** or ⌘⏎ finishes
N	Number	Click to place the next step number (1, 2, 3 …). Drag to give it a pointer
S	Stamp	Emoji stamps (thumbs up, check mark, cross, warning, idea, …) – pick one in the inspector
P	Pencil	Freehand drawing, smoothed

Key	Tool	How it works
H	Highlighter	Transparent marker that doesn't hide the text; ⇧ draws a straight line
X	Obscure	Black out (default), pixelate or blur an area
G	Spotlight	Darkens everything outside the marked areas
Z	Loupe	A round magnifier that enlarges what's beneath 2×
M	Measure	Shows the distance in pixels
I	Colour picker	Click the image to pick a colour; the hex value is copied
C	Crop	Drag the new frame, move it, apply with ⏎; ⇧ = square

Style and colours

- Choose a colour from the palette (keys **1** – **8**) or any colour with the colour well.
- Line width S, M, L or XL; text, number and stamp size S, M, L or XL.
- Changing a style while an item is selected changes that item.
- ⌫ deletes, **⌘D** duplicates, arrow keys nudge (⇧ = 10 px), "To front" brings an item to the top.
- **⌘Z** undo, **⇧⌘Z** redo – as many steps as you like.
- **⌘V** pastes an image (as a movable item) or text.
- Zoom with the trackpad, **⌘+** / **⌘−**, **⌘0** for 100 % and **⌘9** to fit.

Automatic redaction

In the **Annotate** panel, **Personal data** *("Persönliche Daten")* finds and blacks out e-mail addresses, phone numbers, IBANs, card numbers, IP addresses, access keys, tokens and passwords. **Faces** *("Gesichter")* pixelates all faces. You can move, resize or delete every redaction afterwards.

> **Note** Text is blacked out completely on purpose: pixelated text can sometimes be reconstructed. Always check the result before sharing sensitive images.

Frame – make it look great

Switch on **Pretty frame** *("Hübscher Rahmen")* in the **Frame** panel to place your screenshot on a background – perfect for social media, docs and slides.

- **Background:** nine gradients, a solid colour, or none (transparent).
- **Padding**, **corner radius** and **shadow** with sliders.
- **Window frame:** a light or dark title bar with the three traffic-light buttons.
- Alpi remembers your last look for the next image (switched off until you turn it on).

Image adjustments

- In the **Image** panel: brightness, contrast, saturation and sharpness.
- Filters: Vivid, Warm, Cool, Black & White, Noir, Faded, Chrome, Instant and Processed.
- Rotate 90° and flip horizontally – annotations move along.

- **Reset** returns to the original.

Saving and sharing

Button	Result
Copy text *(“Text kopieren”)*	Recognizes all text (and QR codes) in the image and copies it
Pin *(“Anheften”)*	Floats the finished image above all windows
Copy *(“Kopieren”)* `⌘C`	Copies the finished image, including frame
Save *(“Sichern”)* `⌘S`	Saves a PNG into *Alpi* › *Screenshots*. An image from the Orbit is updated in place – the untouched original stays in the history
Done *(“Fertig”)*	Saves (if needed) and closes

> **Tip** Your annotations stay editable. Reopen the image from the Orbit or the history and every arrow and text box is still there.

6 Pinned Images and History

Pinned images

A pinned image floats above all windows on every Space – handy for copying numbers, comparing designs or keeping instructions in view.

Action	Result
Drag	Move the image
Scroll	Zoom in and out around the pointer
`⌥` + scroll	Change the opacity
Double-click	Open in the editor
`⌘C`	Copy
`Esc` or the × (on hover)	Close
Right-click	Copy, edit, original size, opacity 100/80/60/40 %, close

Pin the newest screenshot from the Orbit with `⌃⌥P`. Close all pinned images from the menu bar menu.

History

Open the history with `⌃⌥H`. It shows your recent captures as thumbnails. Each entry keeps the original image together with its annotations, so you can continue editing at any time.

- Double-click an entry to open it in the editor.
- Right-click to pin it, show it in the Finder or delete it.
- By default Alpi keeps the last 40 captures (5–200, see Settings). **Clear history** *(“Verlauf leeren”)* removes everything.

7 Shelf, Clipboard and Smart Actions

The shelf – park any file

Collecting files from different folders? Drag them onto Alpi, switch to the **Actions** wheel and drop them on **Park** *("Parken")*. Alpi carries them in his Orbit – across desktops and into full-screen apps – until you drag them out where you need them. The files stay where they are; Alpi only keeps a reference.

- Drag a single card out, or drag the turquoise stack chip in the Orbit header to take **all parked files at once**.
- Hover a parked card for Copy (as a file), Open and Show in Finder.
- Right-click Alpi › **Clear shelf** *("Ablage leeren")* to empty it.

Smart actions

Hover a screenshot card and click the sparkles button. Alpi looks at the image – only now, never on its own – and offers what fits:

- **Dates** → create a calendar event (opens an .ics in Calendar).
- **Addresses** → show in Maps · **Phone numbers** → call · **Links and e-mail addresses** → open.
- **QR codes and barcodes** → open or copy the content.
- **Tables** → save as an Excel file or copy for Excel/Numbers.
- Copy all text, or turn a found link into a new QR code.
- With Apple Intelligence: **Rename with Apple Intelligence** gives the file a meaningful name; on macOS 27 **Describe** explains what the image shows.

Clipboard history

Press `⌃⌥V` for the last 60 things you copied – texts, links, images and files. Type to search, use the arrow keys and press `⏎` to paste straight into the app you're working in (this needs the Accessibility permission; without it, Alpi just copies).

Key	Action
`⏎`	Paste the selected entry
`⌘C`	Copy only
`⌘R`	Make a QR code
`⌘P`	Park it (text becomes a note, images a card)
`⌘⌫`	Remove the entry
`Esc`	Close

> **Note** The history lives only in memory and is gone when Alpi quits. Content marked as confidential, anything copied from password managers and anything copied while a password field is active is never recorded. By default the history is cleared when you lock the screen and entries are forgotten after 24 hours – see *Privacy & security* below.

Colour picker and QR codes

- `⌃⌥C` shows the macOS magnifier. Click any pixel on screen – the hex value is copied, and Alpi offers the SwiftUI code too.
- **QR code from clipboard** (right-click Alpi or the menu bar menu) turns a copied link or text into a crisp QR code card in the Orbit.

8 Ask Alpi, Presenting and Automation

Ask Alpi

Press `⌃⌥K` (or right-click Alpi › **Ask Alpi** *(“Frag Alpi”)*) and type what you want in plain words. Alpi always understands simple commands in German and English:

- “Capture window”, “whole screen in 5 seconds”, “copy text”, “scrolling capture”, “record video”
- “Selected images to JPG”, “merge selected PDFs”, “park selected files” – works on the files selected in the Finder
- “QR code for https://…”, “pick a colour”, “clipboard”, “history”, “draw on screen”, “camera”

With **Apple Intelligence** (macOS 26 or later) Alpi also understands free requests, multi-step commands (“convert the selected images to PDF and park them”) and answers questions. On **macOS 27** Alpi can look at the screenshot itself: ask “What's on the screenshot?”, “summarize this” or “translate that”. Everything runs with Apple's on-device model; nothing leaves your Mac.

Draw on the screen

Press `⌃⌥D` to draw directly on top of everything – great for presentations, video calls and screen recordings.

Key	Action
`P` `H` `A` `R` `O` `G`	Pen, highlighter, arrow, rectangle, ellipse, spotlight
`1` – `8`	Colours
`F`	Fade strokes after a few seconds, like a laser pointer
`⌫` / `⌘Z`	Undo
`C`	Clear everything
`Esc`	Finish

Your drawings appear in screenshots and screen recordings.

Camera bubble

Show your camera as a round bubble with a turquoise ring (right-click Alpi › **Show camera bubble**). Drag it anywhere, scroll to resize, hover and click × to close. Turn on “Show camera bubble while recording” in Settings to add it to every screen video automatically.

Folder rules

In *Settings* › *Folder rules* *(“Regeln für Ordner”)* Alpi can look after folders for you:

- **Convert new files** – e.g. HEIC photos in Downloads → JPG (any target from the wheels works).
- **Park new files** – new downloads land on Alpi's shelf.
- **Clean up old files** – e.g. screenshots older than 7 days go to the Trash (never deleted permanently).

Shortcuts app

Alpi's actions are available as building blocks in the Shortcuts app, in Spotlight and via Siri: take a screenshot, start/stop a screen video, recognize text in an image, create a QR code, convert files, park files and Ask Alpi.

Alpi's personality

Alpi lives with your day: a nightcap from 10 pm (and he dozes off sooner at night), sunglasses on Friday afternoons and weekends, a Santa hat in December, confetti and a party hat for every 100th screenshot, a good-morning greeting – and after two hours without a break a gentle reminder. Everything can be switched off under *Settings* › *Alpi's character*.

9 Screen Recording

1. Press `⌃⌥R` (or choose **Screen video** *(“Bildschirmvideo”)* in the menu).
2. Drag an area, click a window, or press `F` for the whole screen.
3. A 3-2-1 countdown starts, then Alpi records. A red dashed frame marks the area (it is not recorded).
4. Stop with the red **0:42** in the menu bar or press `⌃⌥R` again.

A result window opens where you can:

- **Play** the video,
- **Trim** it *(“Kürzen”)* – drag the yellow handles and confirm,
- remove the sound *(“Ohne Ton”)*,
- turn it into an animated GIF *(“Als GIF”)*,
- **Copy** the file *(“Kopieren”)* to paste it into Mail, Slack or Messages,
- show it in the Finder *(“Im Finder”)*, or move it to the Trash.

Recording options

Setting	Description
Format	MP4 video or GIF (the GIF is created automatically after recording)
Frames per second	30 or 60
Record system audio	Sound from your apps (Alpi's own sounds are excluded)
Record microphone	Adds your voice as a second audio track
Show clicks	A turquoise ring for left clicks and an amber ring for right clicks
Show pointer	Records the mouse pointer

Setting	Description
3-second countdown	Gives you a moment before recording starts

> **Note** Videos are saved in *Alpi › Aufnahmen*. System audio and microphone are stored as two separate tracks; some players only play the first one. If you quit Alpi while recording, it finishes the file first.

10 Converting Files

Drag one or more files onto Alpi. He grows and shows the possible conversions in his belly. Drop the files on a field to start, or on his face to cancel. Alpi shows a progress ring while working and says *Done* with a **Show in Finder** button.

The three wheels

Key while dragging	Wheel	Contents
⇧	Convert	Target formats for the file type
⌘	Tools	Resize, compress, rotate, merge, split, …
⌃	Actions	AirDrop, copy path, Terminal, copy/move to …, show in Finder

On the desktop, press the key while the files hover over Alpi (or click a tab) to switch wheels. In menu-bar mode, pressing the key while dragging opens the wheel right at your pointer; release on a field to start, in the middle to cancel.

What Alpi can convert

Files	Possible results
Images (PNG, JPG, HEIC, TIFF, GIF, BMP)	PNG, JPG, HEIC, TIFF, GIF, BMP, PDF · resize, compress, rotate, flip, remove background, recognize text, strip metadata, several images → one PDF
PDF	PNG, JPG, TIFF (per page), TXT, RTF, DOCX, HTML · merge, split pages, rotate
Documents (DOCX, RTF, TXT, Markdown, HTML, ODT)	PDF, DOCX, RTF, TXT, HTML, ODT
Spreadsheets (XLSX, CSV, TSV, ODS; XLS and Numbers with LibreOffice/Numbers)	XLSX, CSV, TSV, JSON, HTML, PDF, Markdown – several sheets become one CSV each; German semicolon CSV is detected
Presentations (PPTX, PPT, Keynote, ODP)	PDF, PNG, JPG (per slide) – requires PowerPoint, Keynote or LibreOffice
Video	MP4, MOV, GIF, M4A · without sound, 720p, still frame
Audio	M4A, WAV, AIFF, CAF
Any files	ZIP and unzip

Office files that look like the original

Alpi's built-in conversion handles text and simple formatting. For DOCX → PDF with tables, images, headers and exact layout, Alpi uses a real Office app if one is installed. Choose the engine in *Settings › Converting Office files*:

Engine	Converts	Note
Microsoft Word / PowerPoint	DOCX, DOC, RTF, PPTX → PDF	macOS asks once whether Alpi may control the app
LibreOffice (free)	DOCX, DOC, ODT, PPTX, ODP, XLSX, XLS, ODS → PDF; XLS → XLSX	Runs invisibly, no prompt
Pages / Keynote / Numbers	Pages, Keynote, Numbers, DOCX, PPTX, XLSX → PDF; Numbers/XLS → XLSX	macOS asks once

Automatic tries Microsoft → LibreOffice → iWork → built-in.

> **Note** MP3 output and exotic video formats (MKV, WebM, AVI) are not supported yet. Microsoft Word may ask once to grant access to the output folder.

11 The Alpi Folder and Settings

The Alpi folder

Everything Alpi creates lives in one place – by default *~/Documents/Alpi*. You can move it in Settings.

Folder	Contents
Screenshots	Your captures and the macOS screenshots Alpi collects
Konvertiert	All conversion results (optionally saved next to the original instead)
Aufnahmen	Screen recordings and GIFs
Verlauf	History: original images, annotations and previews

Settings

Open Settings from the menu bar menu, or press `⌘,` while an Alpi window is in front. German section names are shown in brackets.

Section	Options
Where does Alpi live? *(“Wo wohnt Alpi?”)*	Desktop or menu bar · bring Alpi back to the edge · hide in full-screen apps · invisible in screenshots and screen sharing
Capture & edit *(“Aufnehmen & Bearbeiten”)*	Turn the `⌃⌥` shortcuts on/off · what Return does after selecting (copy and save, open editor, save only, copy only) · always save every capture · include pointer · shutter sound · history length
Screen video *(“Bildschirmvideo”)*	MP4 or GIF · 30/60 fps · system audio · microphone · show clicks · show pointer · countdown
Alpi folder *(“Alpi-Ordner”)*	Location, open in Finder, change, reset · save results next to the original

Section	Options
Screenshots	Collect macOS screenshots
Converting Office files *(“Office-Dateien umwandeln”)*	Automatic, Microsoft Office, LibreOffice, Pages/Keynote/Numbers or built-in
System	Launch at login *(“Bei der Anmeldung starten”)*

12 Keyboard Shortcuts

Global

Shortcut	Action
⌃⌥S	Capture area or window
⌃⌥W	Capture window
⌃⌥F	Capture whole screen
⌃⌥T	Copy text from area
⌃⌥L	Scrolling capture
⌃⌥R	Start/stop screen recording
⌃⌥P	Pin newest screenshot
⌃⌥H	History
⌃⌥V	Clipboard history
⌃⌥C	Pick a colour from the screen
⌃⌥K	Ask Alpi
⌃⌥D	Draw on the screen
⌃⌥A	Show/hide Alpi

While selecting

Key	Action
Drag / click	Select area / window
⇧ / ⌥	Square / from the centre
Arrow keys	Move the selection (⇧ = 10 pt, ⌥ = resize)
F	Whole screen
E ⌘C ⌘S T P	Edit, copy, save, text, pin
⏎ / double-click	Quick action
Esc	Cancel

Editor

Key	Action
V A L R O T N S	Select, arrow, line, rectangle, ellipse, text, number, stamp
P H X G Z M I C	Pencil, highlighter, obscure, spotlight, loupe, measure, colour picker, crop
1 – 8	Palette colours
⌘Z ⇧⌘Z	Undo / redo
⌫ ⌘D	Delete / duplicate
⌘C ⌘V ⌘S	Copy image / paste / save
⌘+ ⌘– ⌘0 ⌘9	Zoom in / out / 100 % / fit
⏎ Esc	Apply crop or edit text / deselect, cancel

13 Troubleshooting

Problem	Solution
Captures are black or only show the wallpaper	Allow Alpi under *Privacy & Security* › *Screen & System Audio Recording*, then quit and reopen Alpi.
A ⌃⌥ shortcut does nothing	Another app already uses it. Alpi skips shortcuts that are taken – use the menu bar menu instead, or free the shortcut in the other app.
Alpi is gone	Press ⌃⌥A, or use the menu bar icon › “Bring Alpi back to the edge”. In full-screen apps Alpi hides on purpose (see Settings).
Scrolling capture says “Too fast”	Scroll back a little and continue more slowly, or use Auto-Scroll.
Auto-Scroll doesn't scroll	Allow Alpi under *Privacy & Security* › *Accessibility* and keep the pointer over the area.
No microphone in the video	Allow Alpi under *Privacy & Security* › *Microphone* and turn on “Record microphone”.
DOCX → PDF loses layout	Install LibreOffice (free) or use Word/Pages, and set the Office engine to Automatic.
“Alpi may not control the Office app”	Allow it under *Privacy & Security* › *Automation* › *Alpi*.
macOS screenshots still land on the desktop	Turn on “Collect macOS screenshots” in Settings.

Privacy & security

Alpi works entirely on your Mac. It does not collect analytics and uploads nothing. The only connection it makes on its own is a daily check on GitHub for a new version (Settings › Datenschutz & Sicherheit, can be turned off); it sends nothing about you or your files.

Text recognition, face detection, redaction, Apple Intelligence and all conversions use Apple frameworks (Vision, Core Image, PDFKit, AVFoundation, ScreenCaptureKit, Foundation Models) or the Office app you chose.

Settings › **Datenschutz & Sicherheit** controls what Alpi keeps:

- **History** – kept for 30 days by default (1, 7, 30, 90 days or unlimited) and can be deleted at any time.
- **Redacted images** – once you black something out in the editor and save, the history keeps only the redacted version. Turn on “keep originals of redacted images” if you want to re-edit the redaction later.
- **Clipboard history** – cleared when the screen locks, entries forgotten after 1, 8 or 24 hours, plus your own list of apps Alpi should ignore.
- **Shortcuts app** – a shortcut that captures the whole screen or starts a recording asks for your OK first, unless you allow it permanently.

Beta, feedback and updates

This is a free public beta. Found a bug or have an idea? Use **Feedback geben** in the menu bar menu or by right-clicking Alpi: it opens a GitHub issue with your Alpi and macOS version filled in, or an email if you prefer. When a new version is out, Alpi shows a bubble; **Nach Updates suchen …** checks right away. Download the new version from *github.com/turqislabs/alpi* or *turqislabs.netlify.app/alpi* and replace the app in Applications – settings, history and screenshots stay.

A few safeguards work on their own:

- Links found in screenshots or QR codes open only if they are web, mail or phone links. Look-alike characters, a hidden “user@” part or a bare IP address trigger a warning that shows the full address.
- Folder rules don't open Office documents downloaded from the internet automatically – Alpi asks first.
- Temporary files from the Shortcuts app and calendar events are removed after an hour and when Alpi quits.
- File names and folder paths are not written to the system log in readable form.

Credits

Alpi is made by **turQis Labs**. Parts of the screenshot collection are adapted from *Tendedero* by Alejandro Buján (MIT licence). The capture and editor features were inspired by the feature list of *macshot*; they were written from scratch without using any of its code.
